

TFScope v24 baseline ladder, full metric panel — clean held-out surface (560 PWMs / 95 genes, never trained on, never selected on)

Same 7 rungs, same order, in every panel. Each rung adds one capability, so the gap between two adjacent bars is what that capability buys. Every prediction is registered to the IC-trimmed ground-truth motif core with the same oracle shift + reverse-complement search before scoring. Bars are gene-balanced means; whiskers are 95% gene-level bootstrap CIs.
